

Silicone Silo Bag – Clear Cast

For the staged reduction of gastroschisis and omphalocele

Silo bags from SSP provide a secure, closed environment for exposed viscera during the staged closure of congenital ventral wall defects. They help prevent the loss of peritoneal fluid and minimize the risk of bacterial contamination.

Made of clear implantable-grade silicone, our seamless silo bags enable excellent visualization of their contents. Options include wire-spring or wire-free bag openings and a wide-body style (see back), and all bags feature a reinforced silicone loop for continuous traction.

SSP silo bags are indicated for staged bedside reduction or temporary protection prior to O.R. closure.

- ▼ **Seamless, clear cast silicone** elastomer shell allows for better content visualization
- ▼ **WIRE-SPRING or WIRE-FREE** bag opening to be placed in the defect for a closed environment
- ▼ **Wide range of sizes** (see back)
- ▼ **Continuous postoperative traction** with durable silicone loop on distal end
- ▼ **Sizer ring** included to verify desired bag diameter prior to use
- ▼ **Size imprinted** on each bag
- ▼ **Not made** with natural rubber latex
- ▼ **Supplied sterile**
- ▼ **No expiration**

Choose from bag openings with a **wire spring** encapsulated in silicone or a **wire-free** ring. The opening is placed over the organs, gently compressed to permit insertion into the defect and released. It may then be sutured into place. All bags feature a reinforced distal loop for continuous overhead traction.
